

ERI Target Procedure for use with ANSI/RESNET/ICC 301-2019

This document provides detailed instructions for determining the ENERGY STAR ERI Target, the highest ERI value that each rated multifamily unit, excluding townhouses, may achieve to earn the ENERGY STAR. Note that, in addition to meeting the ENERGY STAR ERI Target for each unit, units shall also meet all Mandatory Requirements for All Multifamily New Construction Projects in Exhibit 2 of the National Oregon and Washington Program Requirements for ENERGY STAR Multifamily New Construction, Version 1/1.1/OR-WA-1.2. While Townhouses are eligible to earn ENERGY STAR Multifamily New Construction certification by meeting their ENERGY STAR ERI Target and also meeting all Mandatory Requirements for All Multifamily New Construction Projects in Exhibit 2 of the National Program Requirements, the instructions for determining their ENERGY STAR ERI Target is in the National Oregon and Washington ERI Target Procedure for ENERGY STAR Single-Family New Homes.

An EPA-recognized Home Certification Organization's (HCO) Approved Software Rating Tool shall automatically determine (i.e., without relying on a user-configured ENERGY STAR Multifamily Reference Design) this target for each Rated Unit. This shall be done by configuring the ENERGY STAR Multifamily Reference Design in accordance with Exhibit 1, the Expanded ENERGY STAR Multifamily Reference Design Definition, and calculating its associated ERI value. The ERI value shall be calculated using ANSI / RESNET / ICC Standard—301-2019 including all Addenda and Normative Appendices, with new versions and Addenda implemented according to the implementation schedule defined by the HCO that the building is being certified under. Any exceptions shall be approved by EPA and reported at www.energystar.gov/ERIExceptions. This value, rounded to the nearest whole number, shall equal the ENERGY STAR ERI Target.

The Oregon and Washington ERI Target Procedure (ANSI 301-2014) must instead be used to determine the ENERGY STAR ERI Target when using ANSI / RESNET / ICC Standard 301-2014.

Exhibit 1: Expanded ENERGY STAR Multifamily Reference Design Definition

Building	Exhibit 1. Expanded ENERGY STAR Multifamily Reference Design Definition						
Component Foundations:	Expanded ENERGY STAR Multifamily Reference Design Definition 1						
Foundations.	Construction Type & Structural Mass: Same as Rated Unit ² , except: • For masonry floor slabs, modeled with 80% of floor area covered by carpet and 20% of floor directly exposed to room air						
	Conditioning Type: Same as Rated Unit ² , except:						
	Crawlspaces shall be modeled as vented with net free vent aperture = 1sq. ft. per 150 sq. ft. of crawlspace floor area						
	Gross Area: Same as Rated Unit ²						
	Insulation: 3,4 Choose appropriate insula	ition level below;					
	Basement Wall Continuous Insulat side of walls	ion R-Value only applies to	conditioned basements;	if applicable, insulati	on shall be locate	d on interior	
	Floor assemblies above crawlspace	e foundations shall be conf	figured to meet the applic	ahle floor assembly I	L-factor listed in th	e huilding	
	component section for Floors Over		ngarea to meet the applic	dalic floor docerribly t	o lactor listed in th	ic ballaling	
	 On-grade and below-grade slab flo 	ors shall be insulated to the		at both the perimete	r for the entire dep	oth of the slab,	
	or 2 ft. if slab depth is not specified by user, and under the entire slab area						
	Climate Zone: 5			CZ 4 C & 5	CZ 6		
	Slab Insulation R-Value: Basement Wall			10	10		
	Continuous Insulation R-Value:			15	15

Oregon and Washington ERI Target Procedure (ANSI 301-2019)

ENERGY STAR Multifamily New Construction, Version 1.2 (Rev. 032)

		AR Multifamily Reference Design Definition	on (Continued)			
Internal	Same as Energy Rating Reference Home, as defined by ANSI / RESNET / ICC-Std. 301					
Mass:	Additional mass specifically designed as a Thermal Storage Element for the Rated Unit shall be excluded					
Lighting,	Lighting: Fraction of qualifying Tier I fixtures to all fixtures in qualifying light fixture locations 90% for interior; 0% for exterior and garage					
Appliances, Fixtures &	Dishwasher: Capacity Same as Rated Unit ² , or Standard if no dishwasher installed in Rated Unit For Standard capacity: LER = 270, GHWC = \$22.23, Elec\$ = \$0.12, Gas\$ = \$1.09, LCY = 208					
Internal						
Gains:						
	For Compact capacity: LER = 203, GHWC = \$14.20, Elec\$ = \$0.12, Gas\$ = \$1.09, LCY = 208 Ceiling Fan: 122 CFM per Watt; Quantity = Number of bedrooms + 1 when ceiling fans present in the Rated Unit; otherwise Quantity = 0					
		ating Reference Home, as defined by ANSI / RESNET / ICC				
	Water fixtures: all showers and faucets ≤ 2.0 gp					
		nce Home, as defined by ANSI / RESNET / ICC Std. 301, ex	cept for adjustments for the lighting,			
	refrigerator, dishwasher, clothes washer, clothes dryer, and ceiling fans specified in this section					
Heating Systems:	Heating capacity shall be selected in accordance with ACCA Manual S based on loads calculated for the Reference Design in accordance of ACCA Manual J, Eighth Edition, ASHRAE Handbook of Fundamentals, or an equivalent computation procedure. For forced-air HVAC systed degraded capacity from Grade III install shall be accounted for using same methodology applied to Energy Rating Reference Home. Where heat from a central boiler is distributed by water-loop heat pumps within the Rated Unit, in accordance with the methodology for the Rated Home in ANSI / RESNET / ICC Std 301, the Reference Design shall be configured such that the heating load is assigned to two separate heating systems: 1) a heat pump with a capacity that is equal to the Reference Design heating load divided by 4.2 COP and 2) a boiler with					
	balance of the capacity of (1-1/4.2) or 76.19%		,			
	Fuel Type: Same as Rated Unit 2,98					
		ns, Grade III airflow and watt draw; for air-source heat pumps				
		eference Design shall be configured with air-source heat punt strip heat, or electric baseboard heat; applicable efficiency				
	Climate Zone: 5	CZ 4C & 5	CZ 6			
	Gas Furn. AFUE:	95	95			
	Oil Furn. AFUE:	85	85			
	Gas Boiler AFUE:	90	90			
	Oil Boiler AFUE:	86	86			
	Central Boiler, ≥ 300 KBtu/h E _t : Central Boiler w/WLHP, ≥ 300 KBtu/h E _t :	86 89	86 89			
	Air-Source Heat Pump HSPF:	9.5	9.5			
	Air-Source Heat Pump Backup:	Electric	Electric			
	Ground-Source Heat Pump COP:	2.8	2.8			
	For non-electric warm furnaces and non-electric boilers, serving the Rated Unit and no other units, the Electric Auxiliary Energy shall be determined in accordance with the methodology for the Energy Rating Reference Home in ANSI / RESNET / ICC Std. 301. For non-electric boilers and GSHPs, serving the Rated Unit and other units through a shared circulation loop, the Electric Auxiliary Energy shall be determined in accordance with the methodology for the Rated Home in ANSI / RESNET / ICC Std. 301, using the same Shared Pump Power (SP _{kW}) OR using 0.85 for motor efficiency and using the same HP as the pump serving the Rated Unitef 0.85

Exhibit 1: Expanded ENERGY STAR Multifamily Reference Design Definition (Continued)

Thermal	Duct Leakage to Outside: The greater of 4 CFM25 per 100 sq. ft. of conditioned floor area or 40 CFM25					
Distribution	Duct Insulation: R-8 on all ducts located in unconditioned space					
Systems:	Duct Surface Area: Same as Rated Unit ² Supply and Return Duct Locations shall be configured according to the number of stories & ceiling type of the Rated Unit using the table below					
	Ceiling Type:	100% Adiabatic Ceiling	All Other			
	One Story Unit:	100% of Supply & Return Ducts in Conditioned Space	100% of Supply & Return Ducts in Vented Attic			
	Multi-story Units:	100% of Supply & Return Ducts in Conditioned Space	75% of Supply & Return Ducts in Vented Attic /			
	-		25% of Supply & Return Ducts in Conditioned Space			
Dehumid-	Type, capacity, efficacy, and dehumidistat setpoint same as Energy Rating Reference Home, as defined by ANSI / RESNET / ICC 301, when					
<u>ifiers</u>	dehumidification system is present in Rated Unit; otherwise none.					
Thermostat:	Type: Programmable					
	Temperature Setpoints: Same as Energy Rating Reference Home, but with offsets for a programmable thermostat, as defined by ANSI /					
	RESNET / ICC Std. 301					
Infiltration &	Compartmentalization Rates: 0.3 cfm50/ft² Enclosure Area, with Aext applied to calculate Infiltration Rate, in accordance with ANSI / RESNET /					
Mechanical						
Ventilation:	Mechanical ventilation system without heat recovery					
	Rate: CFM = 0.01 * CFA + 7.5 * (Nbr + 1), where CFA = Conditioned Floor Area and Nbr = Number of Bedrooms; Runtime: 24 Hours / Day					
	Fan Watts: Watts = CFM Rate / 2.8 CFM per Watt, where CFM Rate is determined above					
	Climate Zone: 5		CZ 4 C & 5 CZ 6			
	Ventilation Type:		Exhaust Exhaust			

Footnotes:

- 1. Any parameter not specified in this exhibit shall be identical to the value entered for the Rated Unit. Where envelope building components do not exist in the Rated Unit, such as a foundation or slab, they should not be modeled in the ENERGY STAR Multifamily Reference Design, unless explicitly stated, such as vented attics where unvented attics are present in the Rated Unit or when needed to locate ducts. Where the envelope component is adiabatic in the Rated Unit, it shall also be adiabatic in the Multifamily Reference Design. Where the envelope component is not adiabatic but is adjacent to a space other than those specified in the Building Component column of Exhibit 1, model as uninsulated in the Reference Design.
- 2. "Same as Rated Unit" indicates that the parameter shall be identical to the value entered for the Rated Unit.
- 3. Slab insulation R-values represent nominal insulation levels; and assembly U-factors for foundations, floors, walls, and ceilings represent the overall assembly, inclusive of sheathing materials, cavity insulation, installation quality, framing, and interior finishes.
- 4. If software allows the user to specify the thermal boundary location independent of the conditioned space boundary in the basement of the Rated Unit, then the thermal boundary of the ENERGY STAR Multifamily Reference Design shall be aligned with this boundary. For example, if the thermal boundary is located at the walls, then the wall insulation shall be configured as if it was a conditioned basement. If the thermal boundary is located at the floor above the basement, then the floor insulation shall be configured as if it was a floor over an unconditioned space.
- 5. 2012 IECC Climate Zone designations, as defined and illustrated in Section R301 of the code, shall be used to configure the ENERGY STAR Reference Design in Oregon and Washington Version 1.2.
- 5.6. Note that the U-factor requirement applies to all fenestration while the SHGC only applies to the glazed portion.
- 6.7. When determining the ENERGY STAR ERI Target, the following formula shall be used to determine total window area of the ENERGY STAR Multifamily Reference Design:

 $AG = 0.15 \times CFA \times FA \times F$

Where:

- AG = Total glazing area
- CFA = Total conditioned floor area
- FA = (Gross above-grade thermal boundary wall area) / (Gross above-grade boundary wall area + 0.5 x Gross below-grade thermal boundary wall area)
- F = 1- 0.44 x (Gross common wall area) / (Gross above-grade thermal boundary wall area + Gross common wall area)

And where:

- Thermal boundary wall is any wall that separates conditioned space from unconditioned space, outdoor environment, or the surrounding soil;
- Above-grade thermal boundary wall is any portion of a thermal boundary wall not in contact with soil;
- Below-grade boundary wall is any portion of a thermal boundary wall in soil contact; AND
- Common wall is the total wall area of walls adjacent to other conditioned space, not including foundation walls.
- 7.8. A vented unconditioned attic shall only be modeled in the Multifamily Reference Design where attics (of any type) exist in the Rated Unit or when specified as the Duct Location in the Thermal Distribution Systems section of this Exhibit. Where the Rated Unit has more than one ceiling type, the ceiling area used to calculate the vent aperture area shall be the area of the ceiling that is exposed to exterior, under attics, and/or under other unconditioned common spaces. Where the Rated Unit is entirely located beneath another dwelling unit or unrated conditioned space, no attic is modeled in the Reference Design.
- 8-9. Fuel type(s) shall be same as Rated Unit, including any dual-fuel equipment where applicable. For a Rated Unit with multiple heating, cooling, or water heating systems using different fuel types, the applicable system capacities and fuel types shall be weighted in accordance with the loads distribution (as calculated by accepted engineering practice for that equipment and fuel type) of the multiple systems, unless otherwise specified by ANSI / RESNET / ICC Std.. 301.
- 9.10. For a Rated Unit without a heating system, the ENERGY STAR Multifamily Reference Design shall be configured with a 78% AFUE gas furnace system, unless the Rated Unit has no access to natural gas or fossil fuel delivery. In such cases, the ENERGY STAR Reference Multifamily Design shall be configured with a 7.7 HSPF air-source heat pump. Where a furnace or boiler is the heating system for the Rated Unit and is rated in combustion efficiency (Ec), the thermal efficiency (Et) shall be modeled as Ec-2%. Where thermal efficiency (Et) is modeled, it shall be converted to AFUE using the following equation: Et = 0.875 x AFUE +10.5%.
- 40.11. For a Rated Unit without a cooling system, the ENERGY STAR Multifamily Reference Design shall be configured with a 13 SEER electric air conditioner.
- 41.12. That is to say, representative of standard-flow plumbing fixtures, reference clothes washer gallons per day, standard distribution system water use effectiveness, a hot water piping ratio of 1.0, no pipe insulation, and no drain water heater recovery.
