This document is intended to summarize comments submitted by stakeholders in response to the Draft 2 Version 3.0 Audio Video Specification distributed on September 9, 2011 and a subsequent memo distributed on November 8, 2011.

Please note: this summary includes only those comments that EPA received permission to make public.

		Signal for a DVD player or other non-	
		amplifier analog product.	
		Stakeholders have suggested that	
		definition of loss of signal should	
4	Down	networking protocol. As an allowance is given for Active and In Use Networking for both the Sleep Mode requirements and the On Mode requirements, a similar adder should be awarded for products in Idle Mode. Auto Power Down may be inappropriate for some commercial audio amplifiers. Professional Commercial amplifiers are often idle for long periods of time in preparation for a performance and must be ready to respond immediately once a performance begins. The revised definition of Loss of Signal in Draft 2 refers to MUP thus is applicable only to amplifiers. This definition does not address Loss of Signal for a DVD player or other nonamplifier analog product. Stakeholders have suggested that	the required power when a product is in Idle Mode, thus an allowance for Active and In-use Networking has been added to the Idle Mode requirement. In consideration of market demands for commercial amplifiers, EPA will allow commercial amplifiers to be shipped with APD disabled as long as the products meethe Idle Mode requirement noted in the Final Draft AV Specification. To ensure that this definition is applicable to products without audio amplification, EPA has added an alternative definition for Loss of Signal referenced to the

		The Draft 2 specification points out the restricted substances in the European	While energy efficiency remains the basis upon which
6	Other Environmental Benefits	Union RoHS Directive as criteria in the ENERGY STAR Audio/Video specifications. While it is accurate that there are limited exemptions with specific expiration dates, manufacturers are only required to demonstrate and document the need for exemptions upon request from the relevant authorities and not as an activity required on an ongoing basis. Draft 2 seems to require manufacturers to demonstrate and document the need for exemptions.	top performers are selected, EPA addresses attributes related to other aspects of product performance in ENERGY STAR specifications as applicable to ensure that overall product performance is maintained relative to a non-qualifying product. By including additional attributes, the ENERGY STAR program seeks to avoid associating the label with models of poor quality or models with features that are not compatible with broadly held consumer or societal interests, thereby preserving the influence of the label in the market. In response to stakeholder concern that placement of toxicity requirements in the product eligibility criteria could hinder international harmonization, EPA is proposing that these criteria reside instead in the ENERGY STAR Partner Commitments document, which is unique to the US market. As such, EPA has removed the Toxicity requirements from the eligibility criteria. Further, in response to feedback, EPA notes in the Partner Commitments document that it is the Agency's intention to harmonize with EU RoHS and that the toxicity requirements are not subject to third-party certification.
8		Draft 2 fails to clearly provide language to exempt the same substances exempted in the European Union RoHS Directive. To avoid confusion and to maintain consistency and harmonization with the RoHS Directive, the ENERGY STAR must consider adding language in Section 7 allowing the same exemptions as those outlined in the RoHS Directive currently in effect.	
7	Safety Requirements	There are products that may be exempt from Safety or EMC requirements that will now be burdened with additional cost for safety/EMC certification when applying for ENERGY STAR certification.	Since proposing compliance with safety requirements in Draft 2, EPA has learned through stakeholder feedback that many different safety standards may apply to A/V products and that referencing applicable local and national safety requirements does not provide enough guidance and clarity to manufacturers. Therefore, at this time, EPA is withdrawing the proposed safety requirements, with the understanding that products sold in the United States are adhering to applicable safety regulations.
9	Audio Amplification	Stakeholders have suggested specific changes to the way that Audio Amplifier Efficiency is tested and calculated. These changes are largely beneficial or applicable to only certain types of products or products with specific use cases.	Although EPA held two focused conference calls and requested supplemental comments on this issue in an attempt to identify and vet an alternate approach, an acceptable path forward for EPA and stakeholders was not identified. Thus, EPA is not proposing further changes to the Audio Amplifier test procedure in this Final Draft Specification. EPA has proposed a demarcation of amplifier types, that would allow the Agency to adapt the Test Method at a later date in a way that acknowledges the unique use cases for commercial vs. residential amplifiers.
